POCKET PEDIATRICS

MORASCHI - ERGENC

FARMÀCIA

Caring for a medically complex child isn't just hard on the child.

62%

of medically complex children
are readmitted within 90 days of discharge

Readmission rate

49%

of caregivers of children with
chronic disease report a very severe burden

Caregiver burden

249hrs

lost per year to scheduling and admin tasks
Parents spend ~32hrs per week on mental load

Admin Tasks

Research Process

Six stages, from broad signals to a validated prototype.

Community Outreach

Surveys & posters

Interviews

Qualitative depth

Data Analysis & Journey Mapping

Reveal hidden behaviours

In the past 6 months, how often have you interacted with healthcare services for your child? (Pharmacy, CAP, Doctors Office, Hospital, Virtual Calls etc)

Prototype & User Testing

14 participants, 5 flows

Sacrificial Concepts

Test ideas early

THE LEAD INSIGHT

Cognitive load —
is the core stressor.

This shaped every design decision we made.

Meet the Caregivers

Juggling Jesse

Mom of Two Under Three

30 Y/O

Graphic Designer

Barcelona

HER COGNITIVE LOAD

Health info scattered across apps, chats, paper, and calendars — nothing in one place.

PAIN POINTS

- Remembering what appointments are needed, and when
- Repeating full medical history at every visit
- Sharing the care load with her partner

"Right now I have three different tools to track everything."

Overwhelmed Oscar

Single Dad of Son with Diabetes

35 Y/O

Project Manager

Barcelona

HIS COGNITIVE LOAD

No guidance between appointments - every escalation is a solo decision with no safety net.

PAIN POINTS

- Medical jargon leaves him unsure of next steps
- No way to track whether things are improving
- Just waiting and hoping between visits

"The hardest part is not knowing if it's a bad day — or an emergency."

Managing a chronic disease costs caregivers ~32 hours a week of mental load.

The Insights

Six statistics across three insights — all pointing to one overloaded caregiver.

Reduce Cognitive Load

Time spent weekly managing care

40%+

of caregivers of medically complex children

Median doctor visits per year

11–15 typical visit range for medically complex children

Pub Med [National Profile of Caregiver Challenges](#)

Speak Their Language

Appointment information recalled

49%

of information was roughly remembered

Visits with unexplained jargon

80%

of visits leave medical terms unexplained

Parents with low health literacy

1 in 4

rises to 1 in 3 in emergency settings

Source: [Surgeon Use of Medical Jargon with Parents in the Outpatient Setting \(PMC6525640\)](#)

Centralize Information

Parents needing coordination help

67%

of parents reported needing care coordination support

Forgone medical care

15.8%

when caregivers spend 5+ hrs/week coordinating

Source: [Inequities in Care Coordination](#)

How Might We

How might we **reduce caregivers' cognitive load** by redesigning the FHS experience so parents leave each visit with **understandable summaries, clear next steps, and a child-friendly story that helps kids understand their diagnosis?**

The real gap isn't access to care.

It's what happens between appointments — fragmented info, jargon parents can't act on, children who don't understand.

249 hrs

lost per year
to scheduling & admin tasks

49%

of visit info forgotten
roughly remembered after leaving

67%

need coordination help
of parents, to manage care

Our solution

An AI-powered care assistant embedded within FHS

"What if every caregiver left each appointment with a clear plan and the confidence to act on it?"

01

Appointment Management

Easy to use appointment booking tools that integrate with caregivers calendars.

02

Follow-Up Instructions

A clear, jargon-free record of every visit. Structured notes the whole care circle can understand and act on.

03

Sharing Tools

A space to share the appointment follow-up and next steps with loved one's. Including a childrens story to easily translate for your kids

See it in Action

Prototype · Live Walkthrough
Pocket Pediatrics

Tested & Validated

Three additions that each close a cognitive load gap in FHS today.

FHS TODAY	THE GAP	POCKET PEDIATRICS
APPOINTMENT MANAGEMENT		
Appointment assistance	No caregiver view	Smart scheduling & management ↓ removes the 249 hrs/yr admin burden
RESULTS & FOLLOW-UP		
Chronic follow-up	Medical language barrier	Translated summaries & kid-friendly stories ↓ closes the 49% recall gap
SHARING WITH YOUR CARE CIRCLE		
Detailed care plans	No way to share with your care circle	Sharing tools & custom profiles ↓ solves the 67% coordination need

All three validated, 14 caregivers, 5 user flows.
Every feature scored above 4.0 / 5, and every one reduces caregiver cognitive load.

Every feature reduces one thing: **cognitive load.**

Our first demo proved the concept. These KPIs are what we'll measure next.

The first demo validated usability and feature concept not yet time saved or comprehension. Below is the direction we are committed to measuring.

Time Saving & Workflow Efficiency

INITIAL RESULT (DEMO)

4.8 / 5

Sharing feature rated #1, all 14 scored 4 or 5

FUTURE TARGET

↓ 249 hrs

per year, in scheduling & admin time per caregiver

Measured via pre/post time-tracking

Caregiver Understanding & Satisfaction

INITIAL RESULT (DEMO)

4.6 / 5

Summary clarity & completeness, above avg

FUTURE TARGET

↑ 80%+

comprehension score after AI translation rollout

Measured via pre/post comprehension quiz

Care Plan Adherence & Follow-Through

INITIAL RESULT (DEMO)

4.0 / 5

Story feature, universally loved

FUTURE TARGET

↑ Adherence

improvement in follow-through, medication & next steps

Measured via app engagement + outcomes

Future Actions & Recommendations

● Already Fixed

Before next test round

- 1 Rename Story → 'Talk to [Child's Name]'
- 2 Fix graph: tooltips, color logic, daily zoom
- 3 Rename Appointments tab to "Appointments and Booking"
- 4 Fix text cut-off on all bottom pages
- 5 Add sharing confirmation toast/popup

● High Impact

Significant UX improvement

- 1 Add doctor verification badge on every summary
- 2 Redesign share page: 'Send To' above content
- 3 Add inline share button per section card
- 4 Add voice input to ai chats and booking
- 5 Make it less text heavy and visually compelling

● Future Iteration

For Fujitsu to implement

- 1 Enrich child profile: photo, DOB, vaccine log and health milestones
- 2 Role-based share presets: full vs. quick summary
- 3 Clarify navigation labels throughout
- 4 Communication presets: Visual / Detailed / Simple

"Oscar and Jesse still have 15+ appointments ahead of them this year. With Pocket Pediatrics inside FHS, they leave each one knowing what happened, what's next, and how to tell their kids."

They no longer feel alone in carrying this cognitive burden and they have time to focus on what truly matters."

The concept reduces cognitive load

Now its up to Fujitsu to refine the features

14

caregivers

4.0+

every feature, /5

3

additions, built on FHS

Already inside the platform you have. No new system to adopt.

Thank You

Appendix

Etnography Map

Research Analysis

- Used two strategies to organize data - grouping via post its & organizing by category within an excel sheet
- Noted & highlighted similar issues between interviewees to determine patterns within the pain points.
- Observed most issues discussed occurred in the pre-appointment phase.
- Lots of focus on reminders for milestones like vaccines, when you need to schedule certain appointments etc.
- Concerns about identifying severity of symptoms and illnesses - “is this normal”.
- If things can be addressed pre-appointment then time can be used more strategically during the appointment.

Refining Personas

- This focus is about helping parents **understand symptoms more confidently**.
- Many parents search for answers, especially at night, but are unsure **what information to trust**.
- They need **quick guidance** to recognize warning signs and decide when to call a doctor.
- Right now, symptom management often feels **stressful, lonely, and reactive**.
- So the design opportunity is to provide **trusted, simple, and timely symptom education**.

Refining Personas

- This focus is about how parents manage **milestones and planning** over time.
- Their biggest challenge is that health information and reminders are **fragmented across too many places**.
- Many are already using several tools, but still feel disorganized and anxious.
- They want a clearer system for **what to track, what comes next, and when to act**.
- So the opportunity is to design one experience that supports **planning, reminders, and shared coordination**.

How Might We & Sacrificial Concept Development

Milestones & Planning

HMW reduce
mental load of
remembering
appointment
follow ups ?

HMW centralize
record keeping
of parents to
keep care giving
organized.

How might we help the
parents and caregivers of
kids 0-10 to create and
understand a creative
place to remember their
milestones?

How might we organize
milestones so parents
understand what's
necessary vs. flexible?

How might we teach
parents about key
milestones without
overwhelming them with
info ?

How might they create a
solution to improve their
children's milestones and
planning in terms of
healthcare?

Follow Up

HMW curate a better
communication
between CG and
doctors of their childs
possible illnesses and
symptoms ?

HMW create an
experience for CG
in order to have
an efficient follow
up for their kids
healthcare ?

HMW create an
efficient medical
past service
which supports
every CG for their
kids ?

Education on Symptoms

How might we reduce
anxiety about the severity
of symptoms through
informal services ?

How might we involve
children in education
of their symptoms to
encourage autonomy
in later years?

How might we help
parents to educate their
children to manage their
own medicines?

How might we help
the parents to
educate their kids
to manage their
own meds ?

Duolingo style
app to teach
people about
symptoms and
+ milestones

Choose your own

as they hit
milestones

DIY Notion
Dashboard

"Weather
dashboard" gives a
"weather outlook"
about milestones
that a child will be
hitting

Digital support
groups with 24/7
access - can ask
questions about
symptoms

Segmentation

- We segmented participants based on whether they rely more on **doctors or Google/AI** for health guidance.
- We also mapped how **supported or unsupported** and **comfortable or uncomfortable** they feel.
- The results show that most users are not in one extreme group they sit across a **spectrum of trust and comfort**.
- Some participants are more open to **digital or AI support**, while others clearly prefer **doctor-led reassurance**.
- This helps us identify different user needs and shows that future solutions should combine **human trust with accessible digital support**.

Customer Journey

It is reported that the Spanish public system allocates only **6 minutes** on average for consultations, which leaves limited time for documentation, explanation, and questions.

Sources - [Patients Memory for Medical information](#)

Customer Journey

Research shows patients forget **40% to 80%** of medical information immediately after a consultation, and about **50%** of what is remembered can be inaccurate.

Sources – [Patients Memory for Medical information](#)

No existing solution delivers all four in one continuous experience

Translation, Scheduling, Follow-up, and AI/Smart UX

Capabilites	 FUJITSU	 ada	 Health Circuit	 La meva /Salut	 KAISER PERMANENTE®	 savia  quirónsalud La salud persona a persona	 Doctoralia

To be Journey

FHS removes the moments Jesse dreads most — the frantic booking, the language gap, the paper she loses on the way home.

Automated scheduling, real-time translation, and structured follow-up are embedded directly into FHS — so every step is supported, not left to Jesse to figure out alone.

She leaves every appointment confident in the diagnosis and clear on what comes next.

To be Journey

FHS removes the moments Jesse dreads most — the frantic booking, the language gap, the paper she loses on the way home.

Automated scheduling, real-time translation, and structured follow-up are embedded directly into FHS — so every step is supported, not left to Jesse to figure out alone.

She leaves every appointment confident in the diagnosis and clear on what comes next.

Solution Evaluation

Desireable

Eliminates language barriers with real-time AI translation during appointments.

Automates scheduling, follow-ups, and documentation so patients and doctors can focus on care.

Viable

Adds direct patient value, increasing FHS platform adoption and stickiness.

Reduces administrative burden on doctors, freeing time for higher-value care.

Feasible

FHS's existing AI and interoperability infrastructure become the technical foundation.

US Companies like – Kaiser Permanente already uses AI note-taking and automated patient follow-ups successfully.

How We Tested

14 participants. 2 expert consultations. 5 user journeys. In homes, cafés, and video calls

7

In-Person Interviews

- Face-to-face, think-aloud walkthroughs
- Homes & public places — natural settings
- 30min per session
- Showcased it to people of all ages
- Think-aloud protocol recorded

7

Virtual Run-Throughs

- Live Figma prototype, clicked live
- Screen share + verbal commentary
- All sessions recorded
- Enabled broader geographic reach
- Remote via Zoom / Meet

2

Expert Consultations

- Javier — IA & narrative critique
- Mariangela — IA & narrative critique
- Trust & liability concerns surfaced
- High-signal design feedback
- Independent professor reviews

14

Total Participants

- Primary caregivers, grandparents, students
- Ages 24–62, varying digital literacy
- 1 structured + 8 observational sessions
- 2 expert professor reviews

5 CORE JOURNEYS TESTED — MAPPED TO DESIGN PRINCIPLES

T1 Open notification & log in

T2 Find appointment summary

T3 Find follow-up tasks

T4 Share with partner

T5 Create child's story

Executive Summary

01

Overall Experience

3.8 / 5

Avg across clarity, completeness & trust scored by 14 participants

02

Top Positives

- Sharing rated #1 tool — fast, intuitive, useful
- Story feature consistently loved by all participants
- Content completeness strong — information thorough
- Structured Notes clearer than full Summary

03

Top Negatives

- No sharing feature directly from Summary and Notes page
- Summary vs. Notes distinction unclear to most users
- No sharing confirmation after sending
- Schedule + Appointments tabs overlap in purpose

04

Areas of Attention

- Text size & readability on smaller screens
- AI trust layer missing — need confirmation of doctor review
- Graphs, tools & tips
- Order of appointment and schedule dates

Appointment Summary & Structured Notes

4.6 /5
Summary Clarity

4.6 /5
Info Completeness

✓ WHAT'S WORKING

- ✓ Structured Notes felt very clear to users
- ✓ Content completeness strong — information thorough
- ✓ Users could locate visit-specific information quickly
- ✓ Overall satisfaction above average across both metrics

✗ WHAT NEEDS FIXING

- ✗ Summary felt overwhelming — too much info visible at first glance
- ✗ Medical jargon in summary hard to understand
- ✗ No tap-to-expand for plain-language explanations
- ✗ Confused between 'recent history' and 'follow-up' sections

→ RECOMMENDATIONS

- Flip hierarchy: Structured Notes first, Summary collapsed
- New order: Red Flags → Next Steps → Medications → Notes
- Add tap-to-expand glossary on every medical term

Structured Notes

High level notes of last appointment

Care Plan

Care plan checklist for caregiver and doctor tracking

Sharing Feature

4.8 /5
#1 Rated Feature

✓ WHAT'S WORKING

- ✓ Highest rated feature — all participants scored 4 or 5 out of 5
- ✓ Intuitive and fast — caregivers found core sharing flow immediately
- ✓ Care circle concept resonated with interviewees
- ✓ Sharing tab structure clear enough that most users completed without friction

✗ WHAT NEEDS FIXING

- ✗ Share button on separate tab — 7/14 users expected on summary screen
- ✗ No confirmation after sharing — users couldn't tell if info was actually sent
- ✗ "Send To" is hidden below the content being shared
- ✗ Share page sends everything by default
- ✗ No role presets — need full report for partner, quick summary for grandparent

→ RECOMMENDATIONS

- Flip hierarchy: Structured Notes first, Summary collapsed
- New order: Red Flags → Next Steps → Medications → Notes
- Add tap-to-expand glossary on every medical term

Sharing Menu

List of who to share with

Sharing Landing Page

Landing interface for sharing

The Story Feature

4.0 /5
Story Feature Avg

✓ WHAT'S WORKING

- ✓ Consistently loved across all participants
- ✓ Caregivers agree it will help explain medical events to children
- ✓ Simple and precise — not overwhelming
- ✓ Tone felt warm and age-appropriate for kids

✗ WHAT NEEDS FIXING

- ✗ Wrong location — should be on follow-up screen, not current placement
- ✗ Covers today's appointment only — not full illness history
- ✗ Reads as a passive story, not an active parent script
- ✗ Name "Simple Story" doesn't signal the feature's purpose clearly

→ RECOMMENDATIONS

- Rename "Simple Story" → "Talk to [Child's Name]"
- Move feature to the follow-up screen
- Reframe copy as parent-facing script, not passive narrative

Defining Medical Terms

Medical terms have “click to define” feature

Story for Marti

AI Generated story to share with your child
